Target Details	
Target:	GALE
Alternative Name:	Gale (GALE Products)
Background:	This gene encodes UDP-galactose-4-epimerase which catalyzes two distinct but analogous
	reactions: the epimerization of UDP-glucose to UDP-galactose, and the epimerization of UDP-N-
	acetylglucosamine to UDP-N-acetylgalactosamine. The bifunctional nature of the enzyme has
	the important metabolic consequence that mutant cells (or individuals) are dependent not only

## Target Details

	on exogenous galactose, but also on exogenous N-acetylgalactosamine as a necessary
	precursor for the synthesis of glycoproteins and glycolipids. Mutations in this gene result in
	epimerase-deficiency galactosemia, also referred to as galactosemia type 3, a disease
	characterized by liver damage, early-onset cataracts, deafness and mental retardation, with
	symptoms ranging from mild (&aposperipheral' form) to severe (&aposgeneralized'
	form). Multiple alternatively spliced transcripts encoding the same protein have been identified.
Molecular Weight:	38.1 kDa
NCBI Accession:	NP_001008217
Pathways:	Response to Water Deprivation, Cellular Glucan Metabolic Process
Application Details	
Application Notes:	Recombinant human proteins can be used for:
	Native antigens for optimized antibody production
	Positive controls in ELISA and other antibody assays
Comment:	The tag is located at the C-terminal.
