Cytosolic and membrane-bound forms of glutathione S-transferase are encoded by two distinct supergene families. These enzymes are involved in cellular defense against toxic, carcinogenic, and pharmacologically active electrophilic compounds. At present, eight distinct classes of the soluble cytoplasmic mammalian glutathione S-transferases have been identified: alpha, kappa, mu, omega, pi, sigma, theta and zeta. This gene encodes a glutathione S-tranferase belonging

	to the alpha class. The alpha class genes, which are located in a cluster on chromosome 6, are
	highly related and encode enzymes with glutathione peroxidase activity that function in the
	detoxification of lipid peroxidation products. Reactive electrophiles produced by oxidative
	metabolism have been linked to a number of degenerative diseases including Parkinson's
	disease, Alzheimer's disease, cataract formation, and atherosclerosis.
