Target Details	
Target:	HIST1H1C
Alternative Name:	Histone h1.2 (HIST1H1C Products)
Background:	Histones are basic nuclear proteins responsible for nucleosome structure of the chromosomal
	fiber in eukaryotes. Two molecules of each of the four core histones (H2A, H2B, H3, and H4)
	form an octamer, around which approximately 146 bp of DNA is wrapped in repeating units,
	called nucleosomes. The linker histone, H1, interacts with linker DNA between nucleosomes
	and functions in the compaction of chromatin into higher order structures. This gene is

	intronless and encodes a replication-dependent histone that is a member of the histone H1
	family. Transcripts from this gene lack polyA tails but instead contain a palindromic termination
	element. This gene is found in the large histone gene cluster on chromosome 6.
Molecular Weight:	21.2 kDa
NCBI Accession:	NP_005310

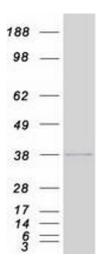

## **Application Details**

Application Notes:	Recombinant human proteins can be used for:
	Native antigens for optimized antibody production
	Positive controls in ELISA and other antibody assays
Comment:	The tag is located at the C-terminal.
