HLA-A3
Hla Class I A-3 Alpha,hla-A (HLA-A3 Products)
HLA-A belongs to the HLA class I heavy chain paralogues. This class I molecule is a heterodimer consisting of a heavy chain and a light chain (beta-2 microglobulin). The heavy chain is anchored in the membrane. Class I molecules play a central role in the immune system by presenting peptides derived from the endoplasmic reticulum lumen. They are expressed in nearly all cells. The heavy chain is approximately 45 kDa and its gene contains 8 exons. Exon 1

## Target Details

	encodes the leader peptide, exons 2 and 3 encode the alpha1 and alpha2 domains, which both
	bind the peptide, exon 4 encodes the alpha3 domain, exon 5 encodes the transmembrane
	region, and exons 6 and 7 encode the cytoplasmic tail. Polymorphisms within exon 2 and exon
	3 are responsible for the peptide binding specificity of each class one molecule. Typing for
	these polymorphisms is routinely done for bone marrow and kidney transplantation. Hundreds
	of HLA-A alleles have been described.
