Background:	This gene belongs to the Ras oncogene family, whose members are related to the transforming genes of mammalian sarcoma retroviruses. The products encoded by these genes function in

signal transduction pathways. These proteins can bind GTP and GDP, and they have intrinsic

GTPase activity. This protein undergoes a continuous cycle of de- and re-palmitoylation, which

regulates its rapid exchange between the plasma membrane and the Golgi apparatus.
Mutations in this gene cause Costello syndrome, a disease characterized by increased growth
at the prenatal stage, growth deficiency at the postnatal stage, predisposition to tumor
formation, mental retardation, skin and musculoskeletal abnormalities, distinctive facial
appearance and cardiovascular abnormalities. Defects in this gene are implicated in a variety of
cancers, including bladder cancer, follicular thyroid cancer, and oral squamous cell carcinoma.
Multiple transcript variants, which encode different isoforms, have been identified for this gene.
