Background:	Voltage-gated potassium (Kv) channels represent the most complex class of voltage-gated ion channels from both functional and structural standpoints. Their diverse functions include regulating neurotransmitter release, heart rate, insulin secretion, neuronal excitability, epithelial electrolyte transport, smooth muscle contraction, and cell volume. This gene encodes a member of the potassium channel, voltage-gated, isk-related subfamily. This member is a small

	integral membrane subunit that assembles with the KCNH2 gene product, a pore-forming	
	protein, to alter its function. This gene is expressed in heart and muscle and the gene mutations	
	are associated with cardiac arrhythmia.
