Target Details		
Target:	MAN2B1	
Alternative Name:	Lysosomal alpha-Mannosidase (MAN2B1 Products)	
Background:	This gene encodes an enzyme that hydrolyzes terminal, non-reducing alpha-D-mannose residues in alpha-D-mannosides. Its activity is necessary for the catabolism of N-linked carbohydrates released during glycoprotein turnover and it is member of family 38 of glycosyl hydrolases. The full length protein is processed in two steps. First, a 49 aa leader sequence is cleaved off and the remainder of the protein is processed into 3 peptides of 70 kDa, 42 kDa (D)	

and 13/15 kDa (E). Next, the 70 kDa peptide is further processed into three peptides (A, B and
C). The A, B and C peptides are disulfide-linked. Defects in this gene have been associated with
lysosomal alpha-mannosidosis. Alternatively spliced transcript variants encoding different
isoforms have been found for this gene.[provided by RefSeq, Mar 2010].
