Background:	The protein encoded by this gene is a highly hydrophobic integral membrane protein belonging to the MAL family of proteolipids. The protein has been localized to the endoplasmic reticulum of T-cells and is a candidate linker protein in T-cell signal transduction. In addition, this

proteolipid is localized in compact myelin of cells in the nervous system and has been

	implicated in myelin biogenesis and/or function. The protein plays a role in the formation,
	stabilization and maintenance of glycosphingolipid-enriched membrane microdomains. Down-
	regulation of this gene has been associated with a variety of human epithelial malignancies.
	Alternative splicing produces four transcript variants which vary from each other by the
	presence or absence of alternatively spliced exons 2 and 3.
