| Background:                   | Mitogen-activated protein kinase 4 is a member of the mitogen-activated protein kinase family.                                       |
|                               | Tyrosine kinase growth factor receptors activate mitogen-activated protein kinases which then  |
|                               | translocate into the nucleus and phosphorylate nuclear targets. Alternative splicing results in                                      |
|                               | multiple transcript variants.  |
| Molecular Weight:             | 65.7 kDa   |
|                               |  |
