Background:	The protein encoded by this gene is a member of the MAP kinase family. MAP kinases act as an integration point for multiple biochemical signals, and are involved in a wide variety of cellular processes such as proliferation, differentiation, transcription regulation and development. This kinase is specifically activated by mitogen-activated protein kinase kinase 5

## Target Details

	(MAP2K5/MEK5). It is involved in the downstream signaling processes of various receptor
	molecules including receptor type kinases, and G protein-coupled receptors. In response to
	extracelluar signals, this kinase translocates to cell nucleus, where it regulates gene expression
	by phosphorylating, and activating different transcription factors. Four alternatively spliced
	transcript variants of this gene encoding two distinct isoforms have been reported.
Molecular Weight:	88.2 kDa
NCBI Accession:	NP_002740
Pathways:	MAPK Signaling, Neurotrophin Signaling Pathway, Activation of Innate immune Response,
	cAMP Metabolic Process, Toll-Like Receptors Cascades, Negative Regulation of intrinsic
	apoptotic Signaling
Application Details	
Application Notes:	Recombinant human proteins can be used for:
	Native antigens for optimized antibody production
	Positive controls in ELISA and other antibody assays
Comment:	The tag is located at the C-terminal.
