Background:	Component of the NuA4 histone acetyltransferase complex which is involved in transcriptional activation of select genes principally by acetylation of nucleosomal histone H4 and H2A. This
	modification may both alter nucleosome - DNA interactions and promote interaction of the modified histones with other proteins which positively regulate transcription. This complex may

	be required for the activation of transcriptional programs associated with oncogene and proto-
	oncogene mediated growth induction, tumor suppressor mediated growth arrest and replicative
	senescence, apoptosis, and DNA repair. The NuA4 complex ATPase and helicase activities
	seem to be, at least in part, contributed by the association of RUVBL1 and RUVBL2 with EP400.
	NuA4 may also play a direct role in DNA repair when directly recruited to sites of DNA damage.
	Also component of the MSIN3A complex which acts to repress transcription by deacetylation
	of nucleosomal histones. [UniProtKB/Swiss-Prot Function]
Molecular Weight:	32.1 kDa
NCBI Accession:	NP_001135892
Pathways:	Regulation of Muscle Cell Differentiation
