Background:	This gene encodes a member of the neuronal calcium sensor (NCS) family of calcium-binding
	proteins. The protein contains an N-terminal myristoylation signal and four EF-hand calcium
	binding loops. The protein is cytosolic at resting calcium levels however, elevated intracellular
	calcium levels induce a conformational change that exposes the myristoyl group, resulting in

## Target Details

	protein association with membranes and partial co-localization with the perinuclear trans-golgi
	network. The protein is thought to be a regulator of G protein-coupled receptor signal
	transduction. Several alternatively spliced variants of this gene have been determined, all of
	which encode the same protein additional variants may exist but their biological validity has not
	been determined.
