Target:	NFKB2
Alternative Name:	Nfkb2,nf-kappa-B p100/p52 (NFKB2 Products)
Background:	This gene encodes a subunit of the transcription factor complex nuclear factor-kappa-B (NFkB).
	The NFkB complex is expressed in numerous cell types and functions as a central activator of
	genes involved in inflammation and immune function. The protein encoded by this gene can

	function as both a transcriptional activator or repressor depending on its dimerization partner.
	The p100 full-length protein is co-translationally processed into a p52 active form.
	Chromosomal rearrangements and translocations of this locus have been observed in B cell
	lymphomas, some of which may result in the formation of fusion proteins. There is a
	pseudogene for this gene on chromosome 18. Alternative splicing results in multiple transcript
	variants.
Molecular Weight:	96.5 kDa
