Background:	This gene encodes a protein that is conserved across metazoans. In vertebrates, this gene is
	linked in a head-to-head arrangement with the adjacent parkin gene, which is associated with
	autosomal recessive juvenile Parkinson's disease. These genes are co-regulated in various
	tissues and they share a bi-directional promoter. Both genes are associated with susceptibility

## Target Details

	to leprosy. The parkin co-regulated gene protein forms a large molecular complex with
	chaperones, including heat shock proteins 70 and 90, and chaperonin components. This protein
	is also a component of Lewy bodies in Parkinson's disease patients, and it suppresses unfolded
	Pael receptor-induced neuronal cell death. Multiple transcript variants encoding different
	isoforms have been found for this gene.
