| Background: | The protein encoded by this gene appears to be multifunctional. Along with PCBP-1 and |
|-------------|---|
| | hnRNPK, it is one of the major cellular poly(rC)-binding proteins. The encoded protein contains |
| | three K-homologous (KH) domains which may be involved in RNA binding. Together with PCBP- |

| | 1, this protein also functions as a translational coactivator of poliovirus RNA via a sequence- |
|---------------------|---|
| | specific interaction with stem-loop IV of the IRES, promoting poliovirus RNA replication by |
| | binding to its 5'-terminal cloverleaf structure. It has also been implicated in translational control |
| | of the 15-lipoxygenase mRNA, human papillomavirus type 16 L2 mRNA, and hepatitis A virus |
| | RNA. The encoded protein is also suggested to play a part in formation of a sequence-specific |
| | alpha-globin mRNP complex which is associated with alpha-globin mRNA stability. This |
| | multiexon structural mRNA is thought to be retrotransposed to generate PCBP-1, an intronless |
| | gene with functions similar to that of PCBP2. This gene and PCBP-1 have paralogous genes |
| | (PCBP3 and PCBP4) which are thought to have arisen as a result of duplication events of entire |
| | genes. Thsi gene also has two processed pseudogenes (PCBP2P1 and PCBP2P2). Multiple |
| | transcript variants encoding different isoforms have been found for this gene. |
