The protein encoded by this gene is a member of the transmembrane 4 superfamily, also known as the tetraspanin family. Most of these members are cell-surface proteins that are characterized by the presence of four hydrophobic domains. The proteins mediate signal transduction events that play a role in the regulation of cell development, activation, growth and

Target Details

	rod and cone photoreceptor cells. It may function as an adhesion molecule involved in
	stabilization and compaction of outer segment disks or in the maintenance of the curvature of
	the rim. This protein is essential for disk morphogenesis. Defects in this gene are associated
	with both central and peripheral retinal degenerations. Some of the various phenotypically
	different disorders are autosomal dominant retinitis pigmentosa, progressive macular
	degeneration, macular dystrophy and retinitis pigmentosa digenic.
