Target Details	
Target:	PREX2 (DEPDC2)
Alternative Name:	Prex2,depdc2 (DEPDC2 Products)
Background:	The protein encoded by this gene belongs to the phosphatidylinositol 3,4,5-trisphosphate
	(PIP3)-dependent Rac exchanger (PREX) family, which are Dbl-type guanine-nucleotide
	exchange factors for Rac family small G proteins. Structural domains of this protein include the

	catalytic diffuse B-cell lymphoma homology and pleckstrin homology (DHPH) domain, two
	disheveled, EGL-10, and pleckstrin homology (DEP) domains, two PDZ domains, and a C-
	terminal inositol polyphosphate-4 phosphatase (IP4P) domain that is found in one of the
	isoforms. This protein facilitates the exchange of GDP for GTP on Rac1, allowing the GTP-
	bound Rac1 to activate downstream effectors. Studies also show that the pleckstrin homology
	domain of this protein interacts with the phosphatase and tensin homolog (PTEN) gene
	product to inhibit PTEN phosphatase activity, thus activating the phosphoinositide-3 kinase
	(PI3K) signaling pathway. Conversely, the PTEN gene product has also been shown to inhibit
	the GEF activity of this protein. This gene plays a role in insulin-signaling pathways, and either
	mutations or overexpression of this gene have been observed in some cancers.
