| Background: | CAMP is a signaling molecule important for a variety of cellular functions. cAMP exerts its |
| | effects by activating the cAMP-dependent protein kinase, which transduces the signal through |
| | a base de la determinación de la defensiva de la desta de la de |

composed of two regulatory and two catalytic subunits. cAMP causes the dissociation of the

| | inactive holoenzyme into a dimer of regulatory subunits bound to four cAMP and two free |

| | monomeric catalytic subunits. Four different regulatory subunits and three catalytic subunits |
| | have been identified in humans. This gene encodes one of the regulatory subunits. This protein |
| | was found to be a tissue-specific extinguisher that down-regulates the expression of seven liver |
| | genes in hepatoma x fibroblast hybrids. Mutations in this gene cause Carney complex (CNC). |
| | This gene can fuse to the RET protooncogene by gene rearrangement and form the thyroid |
| | tumor-specific chimeric oncogene known as PTC2. A nonconventional nuclear localization |
| | sequence (NLS) has been found for this protein which suggests a role in DNA replication via the |
| | protein serving as a nuclear transport protein for the second subunit of the Replication Factor C |
| | (RFC40). Several alternatively spliced transcript variants encoding two different isoforms have |
| | been observed. |
