Alternative Name:	Protein Phosphatase 1a,ppm1a (PPM1A Products)
Background:	The protein encoded by this gene is a member of the PP2C family of Ser/Thr protein
	phosphatases. PP2C family members are known to be negative regulators of cell stress
	response pathways. This phosphatase dephosphorylates, and negatively regulates the activities

## Target Details

	of, MAP kinases and MAP kinase kinases. It has been shown to inhibit the activation of p38 and JNK kinase cascades induced by environmental stresses. This phosphatase can also dephosphorylate cyclin-dependent kinases, and thus may be involved in cell cycle control. Overexpression of this phosphatase is reported to activate the expression of the tumor suppressor gene TP53/p53, which leads to G2/M cell cycle arrest and apoptosis. Three alternatively spliced transcript variants encoding distinct isoforms have been described.
