Background:	The 26S proteasome is a multicatalytic proteinase complex with a highly ordered structure				
	composed of 2 complexes, a 20S core and a 19S regulator. The 20S core is composed of 4				
	rings of 28 non-identical subunits 2 rings are composed of 7 alpha subunits and 2 rings are				
	composed of 7 beta subunits. The 19S regulator is composed of a base, which contains 6				
	ATPase subunits and 2 non-ATPase subunits, and a lid, which contains up to 10 non-ATPase				

Target Details

	subunits. Proteasomes are distributed throughout eukaryotic cells at a high concentration and cleave peptides in an ATP/ubiquitin-dependent process in a non-lysosomal pathway. An essential function of a modified proteasome, the immunoproteasome, is the processing of class I MHC peptides. This gene encodes a non-ATPase subunit of the 19S regulator. Three transcript variants encoding two different isoforms have been found for this gene.
