Background:	This gene encodes a member of the R3 subtype family of receptor-type protein tyrosine
	phosphatases. These proteins are localized to the apical surface of polarized cells and may
	have tissue-specific functions through activation of Src family kinases. This gene contains two

distinct promoters, and alternatively spliced transcript variants encoding multiple isoforms have

	been observed. The encoded proteins may have multiple isoform-specific and tissue-specific
	functions, including the regulation of osteoclast production and activity, inhibition of cell
	proliferation and facilitation of apoptosis. This gene is a candidate tumor suppressor, and
	decreased expression of this gene has been observed in several types of cancer.
