Key regulator of entry into cell division. Directly involved in heterochromatin formation by maintaining overall chromatin structure and, in particular, that of constitutive heterochromatin by stabilizing histone methylation. Recruits and targets histone methyltransferases KMT5B and KMT5C, leading to epigenetic transcriptional repression. Controls histone H4 'Lys-20' trimethylation. Probably acts as a transcription repressor by recruiting chromatin-modifying

rarget Details	
	enzymes to promoters. Potent inhibitor of E2F-mediated trans-activation, associates
	preferentially with E2F5. Binds to cyclins A and E. Binds to and may be involved in the
	transforming capacity of the adenovirus E1A protein. May act as a tumor suppressor.
