Background:	Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a large 60S subunit. Together these subunits are composed of 4 RNA species and approximately 80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of the 60S subunit. The protein belongs to the L13E family of ribosomal proteins. It is located in

	the cytoplasm. This gene is expressed at significantly higher levels in benign breast lesions	
	than in breast carcinomas. Alternatively spliced transcript variants encoding distinct isoforms	
	have been found for this gene. As is typical for genes encoding ribosomal proteins, there are	
	multiple processed pseudogenes of this gene dispersed through the genome.
