Alternative Name:	Rpl38 (RPL38 Products)
Background:	Ribosomes, the organelles that catalyze protein synthesis, consist of a small 40S subunit and a
	large 60S subunit. Together these subunits are composed of 4 RNA species and approximately
	80 structurally distinct proteins. This gene encodes a ribosomal protein that is a component of

the 60S subunit. The protein belongs to the L38E family of ribosomal proteins. It is located in

	the cytoplasm. Alternative splice variants have been identified, both encoding the same protein.
	As is typical for genes encoding ribosomal proteins, there are multiple processed pseudogenes
	of this gene dispersed through the genome, including one located in the promoter region of the
	type 1 angiotensin II receptor gene.
