Product Details	
Characteristics:	 Recombinant human SCP2 / SCPX (transcript variant 1) protein expressed in HEK293 cells. Produced with end-sequenced ORF clone
Purity:	> 80 % as determined by SDS-PAGE and Coomassie blue staining
Target Details	
Target:	SCP2
Alternative Name:	Scp2,scpx (SCP2 Products)
Background:	This gene encodes two proteins: sterol carrier protein X (SCPx) and sterol carrier protein 2
	(SCP2), as a result of transcription initiation from 2 independently regulated promoters. The
	transcript initiated from the proximal promoter encodes the longer SCPx protein, and the
	transcript initiated from the distal promoter encodes the shorter SCP2 protein, with the 2

	proteins sharing a common C-terminus. Evidence suggests that the SCPx protein is a
	peroxisome-associated thiolase that is involved in the oxidation of branched chain fatty acids,
	while the SCP2 protein is thought to be an intracellular lipid transfer protein. This gene is highly
	expressed in organs involved in lipid metabolism, and may play a role in Zellweger syndrome, in
	which cells are deficient in peroxisomes and have impaired bile acid synthesis. Alternative
	splicing of this gene produces multiple transcript variants, some encoding different
	isoforms.[provided by RefSeq, Aug 2010].
Molecular Weight:	58.8 kDa
