Target Details

Target: SEPHS2

Alternative Name: Sephs2 ([SEPHS2 Products](#))

Background: This gene encodes an enzyme that synthesizes selenophosphate from selenide and ATP. Selenophosphate is the selenium donor used to synthesize selenocysteine, which is co-translationally incorporated into selenoproteins at in-frame UGA codons. Genes encoding selenocysteine contain a stem-loop secondary structure in their 3' UTR called a selenocysteine insertion sequence (SECIS) element. The protein encoded by this gene contains a

selenocysteine residue in its predicted active site. There is a pseudogene for this gene on chromosome 5.

Molecular Weight: 47.1 kDa

NCBI Accession: [NP_036380](#)
