Background:	This gene is a member of the tropomyosin family of highly conserved, widely distributed actin- binding proteins involved in the contractile system of striated and smooth muscles and the	

cytoskeleton of non-muscle cells. Tropomyosin is composed of two alpha-helical chains

arranged as a coiled-coil. It is polymerized end to end along the two grooves of actin filaments
and provides stability to the filaments. The encoded protein is one type of alpha helical chain
that forms the predominant tropomyosin of striated muscle, where it also functions in
association with the troponin complex to regulate the calcium-dependent interaction of actin
and myosin during muscle contraction. In smooth muscle and non-muscle cells, alternatively
spliced transcript variants encoding a range of isoforms have been described. Mutations in this
gene are associated with type 3 familial hypertrophic cardiomyopathy.
