Background:	This gene encodes a member of the tropomyosin family of actin-binding proteins involved in
	the contractile system of striated and smooth muscles and the cytoskeleton of non-muscle
	cells. Tropomyosins are dimers of coiled-coil proteins that polymerize end-to-end along the

	major groove in most actin filaments. They provide stability to the filaments and regulate
	access of other actin-binding proteins. In muscle cells, they regulate muscle contraction by
	controlling the binding of myosin heads to the actin filament. Multiple transcript variants
	encoding different isoforms have been found for this gene.
