Target Details		
Target:	PATZ1 (ZNF278)	
Alternative Name:	Znf278 (ZNF278 Products)	
Background:	The protein encoded by this gene contains an A-T hook DNA binding motif which usually binds	
	to other DNA binding structures to play an important role in chromatin modeling and	
	transcription regulation. Its Poz domain is thought to function as a site for protein-protein	
	interaction and is required for transcriptional repression, and the zinc-fingers comprise the DNA

	binding domain. Since the encoded protein has typical features of a transcription factor, it is	
	postulated to be a repressor of gene expression. In small round cell sarcoma, this gene is fused	
	to EWS by a small inversion of 22q, then the hybrid is thought to be translocated	
	(t(122)(p36.1q12). The rearrangement of chromosome 22 involves intron 8 of EWS and exon 1	
	of this gene creating a chimeric sequence containing the transactivation domain of EWS fused	
	to zinc finger domain of this protein. This is a distinct example of an intra-chromosomal	
	rearrangement of chromosome 22. Four alternatively spliced transcript variants are described	
	for this gene.
