Target Details

| Background: | Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal response |
|---------------------|--|
| | that triggers the perception of a smell. The olfactory receptor proteins are members of a large |
| | family of G-protein-coupled receptors (GPCR) arising from single coding-exon genes. Olfactory |
| | receptors share a 7-transmembrane domain structure with many neurotransmitter and |
| | hormone receptors and are responsible for the recognition and G protein-mediated |
| | transduction of odorant signals. The olfactory receptor gene family is the largest in the |
| | genome. The nomenclature assigned to the olfactory receptor genes and proteins for this |
| | organism is independent of other organisms. |
