48 genes and 7 gene subfamilies. This gene is a member of ABC gene subfamily A (ABCA).
Genes within the ABCA family typically encode several thousand amino acids. Like other ABC
transmembrane transporter proteins, this protein has 12 or more transmembrane alpha-helix
domains that likely arrange to form a single central chamber with multiple substrate binding
sites. It is also predicted to have two large extracellular domains and two nucleotide binding
domains as is typical for ABCA proteins. Alternative splice variants have been described but
their biological validity has not been demonstrated.
