Target Details

Alternative Name:	HMBS (HMBS Products)	
Background:	HMBS is a member of the hydroxymethylbilane synthase superfamily. It is the third enzyme of	
	the heme biosynthetic pathway and catalyzes the head to tail condensation of four	
	porphobilinogen molecules into the linear hydroxymethylbilane. Mutations in this gene are	
	associated with the autosomal dominant disease acute intermittent porphyria. This gene	
	encodes a member of the hydroxymethylbilane synthase superfamily. The encoded protein is	
	the third enzyme of the heme biosynthetic pathway and catalyzes the head to tail condensation	
	of four porphobilinogen molecules into the linear hydroxymethylbilane. Mutations in this gene	
	are associated with the autosomal dominant disease acute intermittent porphyria. Alternatively	
	spliced transcript variants encoding different isoforms have been described.
