Background:	This gene encodes a glycosylated phosphoprotein with a leucine zipper motif, two helix-loophelix motifs (I repeats) that are similar to domains found in the TFII-I family of transcription factors, one CHARLIE8 transposable element-like sequence, and a BED zinc finger. This gene lies within a region that is deleted in Williams-Beuren syndrome. Alternatively spliced variants which encode different protein isoforms have been described, however, not all variants have been fully characterized. Protein Size: 437
Molecular Weight:	48 kDa
