### Target Details

Target:	MRPL43

Background:	Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in protein
	synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes) consist of a

	small 28S subunit and a large 39S subunit. They have an estimated 75 % protein to rRNA
	composition compared to prokaryotic ribosomes, where this ratio is reversed. Another
	difference between mammalian mitoribosomes and prokaryotic ribosomes is that the latter
	contain a 5S rRNA. Among different species, the proteins comprising the mitoribosome differ
	greatly in sequence, and sometimes in biochemical properties, which prevents easy recognition
	by sequence homology. This gene encodes a 39S subunit protein. This gene and the gene for a
	semaphorin class 4 protein (SEMA4G) overlap at map location 10q24.31 and are transcribed in
	opposite directions.
