Background:	<p>Mammalian mitochondrial ribosomal proteins are encoded by nuclear genes and help in protein synthesis within the mitochondrion. Mitochondrial ribosomes (mitoribosomes) consist of a small 28S subunit and a large 39S subunit. They have an estimated 75 % protein to rRNA composition compared to prokaryotic ribosomes, where this ratio is reversed. Another difference between mammalian mitoribosomes and prokaryotic ribosomes is that the latter contain a 5S rRNA. Among different species, the proteins comprising the mitoribosome differ greatly in sequence, and sometimes in biochemical properties, which prevents easy recognition by sequence homology. This gene encodes a 28S subunit protein that belongs to the ribosomal protein S5P family. Pseudogenes corresponding to this gene are found on chromosomes 4q, 5q, and 18q.</p> <p>Protein Interaction Partner: TP53, SUMO2, UBC, C1QBP, MRPL24, TMEM43, MRPS35, MRPS10, ZMPSTE24, FLOT1, UQCRFS1P1, TUFM, SDHB, ILF3, GALNT2, EEF2, CORO1C, CAND1, CUL3, ICT1, DDX56,</p> <p>Protein Size: 251</p>
