## Target Details

| Background:         | Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal response      |
|---------------------|---|
|                     | that triggers the perception of a smell. The olfactory receptor proteins are members of a large       |
|                     | family of G-protein-coupled receptors (GPCR) arising from single coding-exon genes. Olfactory         |
|                     | receptors share a 7-transmembrane domain structure with many neurotransmitter and                     |
|                     | hormone receptors and are responsible for the recognition and G protein-mediated                      |
|                     | transduction of odorant signals. The olfactory receptor gene family is the largest in the             |
|                     | genome. The nomenclature assigned to the olfactory receptor genes and proteins for this               |
|                     | organism is independent of other organisms.   |
