Target Details

Background:	Olfactory receptors interact with odorant molecules in the nose, to initiate a neuronal response				
	that triggers the perception of a smell. The olfactory receptor proteins are members of a large				
	family of G-protein-coupled receptors (GPCR) arising from single coding-exon genes. Olfactory				
	receptors share a 7-transmembrane domain structure with many neurotransmitter and				
	hormone receptors and are responsible for the recognition and G protein-mediated				
	transduction of odorant signals. The olfactory receptor gene family is the largest in the				
	genome. The nomenclature assigned to the olfactory receptor genes and proteins for this				
	organism is independent of other organisms.
