Background:	Synonyms: CNA2, KERA, KERA_HUMAN, Keratan sulfate proteoglycan keratocan, Keratocan, KTN, SLRR2B.	
	Background: Small leucine-rich proteoglycans (SLRPs) such as Decorin, Biglycan, Fibromod-	
	ulin, Keratocan, Lumican and Osteoglycin mediate extracellular matrix organization and are	
	binding partners of TGF Beta. The Decorin core protein binds to growth factors, intercellular	
	matrix molecules such as Fibronectin and Throm-bospondin, and to the Decorin endocytosis	
	receptor. Fibromodulin is a collagen-binding keratan sulphate proteoglycan that influences	
	adhesion processes of connective tissue and plays a role in fibrillogenesis by regulating	
	collagen fibril spacing and thickness. Keratocan (KTN) develops corneal transparency and	
	maintains the stromal matrix structure. Keratocan is a secreted protein in the extracellular	
	matrix that binds to keratan sulfate chains. Keratocan is mainly detected in the cornea, but can	
	also be expressed in trachea, intestine, ovary, lung and skeletal muscle. Defects in the gene	
	encoding for Keratocan can cause cornea plana 2 (CNA2), an autosomal recessive disorder	
	where the forward convex curvature of the cornea is flattened.	
Pathways:	Glycosaminoglycan Metabolic Process
