associated RING-CH protein II, RING finger protein 172, RNF172.	
Background: Ubiquitination is an important mechanism through which three classes of	
enzymes act in concert to target short-lived or abnormal proteins for destruction. The three	
classes of enzymes involved in ubiquitination are the ubiquitin-activating enzymes (E1s), the	
ubiquitin-conjugating enzymes (E2s) and the ubiquitin-protein ligases (E3s). MARCH2	
(membrane-associated ring finger (C3HC4) 2), also known as RNF172 or HSPC240, is a 246	
amino acid multi-pass membrane protein that localizes to the endoplasmic reticulum and	
contains one RING-CH-type zinc finger. Expressed in a variety of tissues, MARCH2 functions as	
an E3 ubiquitin-protein ligase that is thought to mediate the ubiquitination and subsequent	
degradation of CD71 and B7-2 and may be involved in endosomal protein trafficking.
