	protein, Myofibrillar titin-like Ig domains protein, MYOT, MYOTI_HUMAN, Myotilin, Titin
	immunoglobulin domain protein, TTID, TTID protein.
	Background: Myotilin, a sarcomeric protein that is encoded by the gene mapping to human
	chromosome 5q31, binds to a-actinin and is localized in the Z-line of myofibrils. Myotilin is
	expressed in skeletal and cardiac muscle, and it co-localizes with a-actinin in the sarcomeric I-
	bands where it directly interacts with a-actinin. Defects in the myotilin gene are reported to
	cause a form of autosomal dominant limb-girdle muscular dystrophy (LGMD). Symptoms of
	adult onset LGMD are progressive weakness of the hip and shoulder girdles as well as a
	distinctive dysarthric pattern of speech. The muscle of affected individuals with LGMD shows
	degeneration of myofibers, variations in fiber size, fiber splitting, centrally located myonuclei
	and an enhanced number of autophagic vesicles.
