	Background: FAM84A is a 292 amino acid protein that belongs to the FAM84 family of proteins
	Predominantly expressed in testis, FAM84A shares 44 % amino acid identity with the related
	protein FAM84B. FAM84A localizes to a subcellular membrane region where there is no contac
	between neighboring cells and is believed to play a role in cell morphology and motility. More
	specifically, the expression of FAM84A increases cell motility. Two FAM84A isoforms are
	expressed due to alternative splicing events. Isoform 2 can be phosphorylated on various serio
	residues and this phosphorylation is associated with cellular morphology. FAM84A is
	upregulated in colorectal cancer, lung cancer, pancreatic cancer, cholangiocarcinoma and
	bladder cancer tissues. Via its ability to increase cell motility, FAM84A may contribute to the
	invasion and metastasis of cancer cells.
