Background:	Synonyms: Homeobox protein PBX3, MGC134053, OTTHUMP00000064213, Pbx 3, Pbx3,	
	PBX3_HUMAN, Pre B cell leukemia homeobox 3, Pre B cell leukemia transcription factor 3, Pre-	
	B-cell leukemia transcription factor 3, RP11 336P12.1.	
	Background: Pbx 1, 2, 3 and 4 are members of the TALE (three amino acid loop extension)	
	family of homeodomain-containing proteins. Human pre-B cell acute leukemias are frequently	
	associated with a t(1,19)(q23,p13.3) chromosomal rearrangement, which creates a chimeric	
	gene encoding a fusion between the E2A and Pbx 1 gene products. Pbx 2 and Pbx 3 share 92 $\%$	
	and 94 % respective identities with Pbx 1 over a 266 amino acid region flanking their homeobox	
	domains, while all three proteins are quite divergent at their amino- and carboxy-termini. Two	
	forms of Pbx 1 and Pbx 3 each differ primarily in their carboxy-termini and result from	
	alternative mRNA splicing. Unlike other homeotic selector genes which are expressed	
	transiently during development and differentiation, Pbx gene transcripts are ubiquitously	
	expressed in both fetal and adult tissues and cell lines. Additionally, Pbx 2 and Pbx 3 transcripts	
	are detected in lymphoid cells, which do not express Pbx 1. Pbx 4 expression is confined to the	
	testis, especially to spermatocytes in the pachytene stage of the first meiotic prophase.	
Gene ID:	5090
