	Background: Protocadherins are a large family of cadherin-like cell adhesion proteins that are
	involved in the establishment and maintenance of neuronal connections in the brain. There are
	three protocadherin (PCDH) gene clusters, designated alpha, beta and gamma, all of which
	contain multiple tandemly arranged genes. PCDHGA9 (Protocadherin gamma-A9) is a 932
	amino acid that is one of 22 proteins encoded by the protocadherin gamma cluster. The
	protocadherein gamma cluster consists of three subfamilies (A, B and C) and PCDHGA9 is a
	member of the gamma subfamily A. PCDHGA9 is a type I transmembrane receptor containing
	six cadherin motifs and is expressed in the central nervous system where it localizes to
	synapses. Members of the gamma cluster of protocadherins are essential for neuronal survival.
	There are two isoforms of PCDHGA9 that are produced as a result of alternative splicing
	events.
