Background:	Synonyms: AGC1, Araceli hiperlarga, ARALAR, ARALAR1, Calcium binding mitochondrial carrier superfamily member, Calcium-binding mitochondrial carrier protein Aralar1, CMC1_HUMAN, Mitochondrial aspartate glutamate carrier 1, SLC25A12, Solute carrier family 25 member 12, solute carrier family 25, member 12. Background: Calcium signaling in mitochondria is important in order for it to function in response to a variety of extracellular stimuli. Signaling begins with Ca(2+) entry in mitochondria via the Ca(2+) uniporter followed by Ca(2+) activation of three dehydrogenases in the mitochondrial matrix. ARALAR, the neuronal Ca(2+)-binding mitochondrial aspartate-glutamate carrier, has Ca(2+) binding domains facing the extramitochondrial space and functions in the malate-aspartate NADH shuttle (MAS). ARALAR is encoded by the SLC25A12 gene and is expressed in brain and skeletal muscle. ARALAR is required for the synthesis of brain aspartate and N-acetylaspartatemay and plays a role in myelin formation. It is also essential for the transmission of small Ca(2+) signals to mitochondria via an increase in mitochondrial NADH. In addition, ARALAR is implicated in conferring susceptibility to schizophrenia.
