	DNA-binding protein-interacting protein 1, SOSS C, SOSS complex subunit C, SOSS-C, SOSSC,
	SOSSC_HUMAN, SSB-interacting protein 1, Ssbip1, C9orf80, INTS3- and NABP-interacting
	protein
	Background: The SOSS (Sensor of single-strand DNA) complex consists of multiple proteins
	that promote DNA repair and G2/M checkpoint downstream of the MRN (Mre11, Rad50 and
	Nbs1) complex. The complex is composed of SSBP1, INTS3 and C9orf80. Specifically, the
	SOSS complex binds to ssDNA at DNA lesions that influences diverse endpoints in the cellular
	DNA damage response. The complex is required for efficient homologous recombination-
	dependent repair of double-stranded breaks and ATM-dependent signaling pathways. C9orf80,
	also known as SOSS complex subunit C and Single-stranded DNA-binding protein-interacting
	protein 1 (SSBIP1), is a 104 amino acid nuclear protein that is a component of the SOSS
	complex. Upon DNA damage, C9orf80 along with other components of the SOSS complex
	migrate to the nucleus. There are two isoforms of C9orf80 that are produced as a result of
	alternative splicing events.
