### Target Details

Background:	Synonyms: SPP24, SPP-24, Secreted phosphoprotein 24, Secreted phosphoprotein 2, SPP2	
	Background: SPP24, also known as secreted phosphoprotein 2, is a 211 amino acid secreted	
	protein that belongs to the cystatin superfamily. Expressed in liver and plasma, SPP24 may play	
	a role in coordinating an aspect of bone turnover. The gene that encodes SPP24 maps to	
	human chromosome 2, which consists of 237 million bases encoding over 1,400 genes, making	
	up approximately 8 % of the human genome. A number of genetic diseases are linked to genes	
	on chromosome 2. Harlequin icthyosis, a rare and morbid skin deformity, is associated with	
	mutations in the ABCA12 gene. The lipid metabolic disorder sitosterolemia is associated with	
	ABCG5 and ABCG8. An extremely rare recessive genetic disorder, Alstr syndrome is due to	
	mutations in the ALMS1 gene. Interestingly, chromosome 2 contains what appears to be a	
	vestigial second centromere and vestigial telomeres which gives credence to the hypothesis	
	that human chromosome 2 is the result of an ancient fusion of two ancestral chromosomes	
	seen in modern form today in apes.
