containing gene 6B protein, TNR6B_HUMAN.
Background: TNRC6B is a 1,723 amino acid protein that exists as two alternatively spliced
isoforms and is thought to be involved in mRNA cleavage events. Expressed ubiquitously,
TNRC6B contains one glycine/tryptophan (GW)-rich N-terminal domain, one central glutamine-
rich region and one C-terminal RNA recognition motif and is encoded by a gene that maps to
human chromosome 22. Mutations in several of the genes that map to chromosome 22 are
involved in the development of Phelan-McDermid syndrome, Neurofibromatosis type 2, autism
and schizophrenia. Additionally, translocations between chromosomes 9 and 22 may lead to
the formation of the Philadelphia Chromosome and the subsequent production of the novel
fusion protein BCR-Abl, a potent cell proliferation activator found in several types of leukemias.

Pathways:

Fc-epsilon Receptor Signaling Pathway, Regulatory RNA Pathways, EGFR Signaling Pathway
