	Background: ITAGV encodes integrin alpha chain V. Integrins are heterodimeric integral	
	membrane proteins composed of an alpha chain and a beta chain. The I-domain containing	
	integrin alpha V undergoes post-translational cleavage to yield disulfide-linked heavy and light	
	chains, that combine with multiple integrin beta chains to form different integrins. Among the	
	known associating beta chains (beta chains 1,3,5,6, and 8, 'ITGB1', 'ITGB3', 'ITGB5', 'ITGB6', and	
	'ITGB8'), each can interact with extracellular matrix ligands, the alpha V beta 3 integrin, perhaps	
	the most studied of these, is referred to as the Vitronectin receptor (VNR). In addition to	
	adhesion, many integrins are known to facilitate signal transduction. The ITGB3 protein product	
	is the integrin beta chain beta 3. Integrins are integral cell-surface proteins composed of an	
	alpha chain and a beta chain. A given chain may combine with multiple partners resulting in	
	different integrins. Integrin beta 3 is found along with the alpha IIb chain in platelets. Integrins	
	are known to participate in cell adhesion as well as cell-surface mediated signalling.
