Background: Cadherins are calcium-dependent cell-cell adhesion molecules, and
protocadherins constitute a subfamily of nonclassic cadherins. Protocadherin beta 13 is a
member of the protocadherin beta gene cluster, one of three related gene clusters tandemly
linked on chromosome five. The gene clusters demonstrate an unusual genomic organization
similar to that of B-cell and T-cell receptor gene clusters. The beta cluster contains 16 genes
and 3 pseudogenes, each encoding 6 extracellular cadherin domains and a cytoplasmic tail that
deviates from others in the cadherin superfamily. The extracellular domains interact in a
homophilic manner to specify differential cell-cell connections. Unlike the alpha and gamma
clusters, the transcripts from these genes are made up of only one large exon, not sharing
common 3' exons as expected. These neural cadherin-like cell adhesion proteins are integral
plasma membrane proteins. Their specific functions are unknown but they most likely play a
critical role in the establishment and function of specific cell-cell neural connections.
