Background:	Synonyms: Na+/myo inositol cotransporter, Na+/myo-inositol cotransporter, SC5A3_HUMAN,
	SLC5A3, SMIT, SMIT2, sodium/myo inositol cotransporter 1, Sodium/myo inositol
	cotransporter, Sodium/myo-inositol cotransporter, solute carrier family 5 inositol transporters,
	member 3, Solute carrier family 5 member 3.
	Background: Myo-inositol is involved in many important aspects of cellular regulation including
	membrane structure, signal transduction and osmoregulation. It is taken up into cells by the
	sodium/myo-inositol cotransporter (SMIT). SMIT activity maintains intracellular concentrations
	of myo-inositol, it is upregulated in response to hypertonic stress. The human SMIT protein is
	encoded by the SLC5A3 gene, which maps to chromosome 21q22.12. It is expressed in many
	human tissues, such as brain, kidney and placenta. Specifically, SMIT is abundantly expressed
	throughout the whole brain and spinal cord in fetal rat, but is downregulated in adult rat brain
	with the exception of the choroid plexus, where SMIT expression remains high. In kidney, SMIT
	localizes to the baso-lateral membranes of the thick ascending limb of Henle (TAL) and the
	inner medullary collecting duct (IMCD). Impaired SMIT activity is implicated in the pathogenesis
	of diabetes and Down syndrome.
